# CCR 2020 Inspection Report AES Puerto Rico

## Introduction

Purpose Annual inspection under the Standards for the Disposal of Coal

Combustion Residuals From Electric Utilities of April 17, 2015

(CCR Rule).

Scope Review of available information and perform a remote visual

inspection of the AES Puerto Rico (AES-PR) Agremax<sup>TM</sup> Stockpile Area in line with the current pandemic-related

limitations.

### **Facility Location**

General AES-PR is located in the south coast of the island of Puerto Rico,

about 3.4 miles southwest of downtown Guayama.

**Address** AES Puerto Rico

Km 142.0 State Road PR-3 Guayama, Puerto Rico 00784

## **Facility Description**

AES-PR is a bituminous coal power plant that generates and sells electricity to the Puerto Rico Electric Power Authority with a total power generation capacity of 520 Megawatts; this represents approximately 15% of the electricity consumed on the island. Using its own CCRs, AES-PR also produces a manufactured aggregate, known as Agremax<sup>TM</sup>. Dry ashes that are not delivered to off-site users are mixed in a pug mill that conditions this CCR to produce Agremax<sup>TM</sup> before feeding a conveyor belt used to transfer the mixture to the Stockpile Area at the facility. A stockpile to store the inventory of Agremax<sup>TM</sup> is formed by a bulldozer or by dump trucks that are loaded with Agremax<sup>TM</sup> by an excavator or front end loader; the trucks then place the Agremax<sup>TM</sup> onto a stockpile. From the Stockpile Area the Agremax<sup>TM</sup> is loaded by an excavator or front-end loader into dump trucks and sent for transport by public highway to off-site users in accordance with applicable laws and regulations. Alternatively, the Agremax<sup>TM</sup> can be fed by a bulldozer into a crusher located in the Stockpile Area. The crusher feeds a conveyor to transfer the Agremax<sup>TM</sup> to marine vessels in the AES-PR dock area for shipment overseas.

## **CCR Unit Description**

**Location** The Stockpile Area is located at the southeast quadrant of the

AES-PR site, south of the power plant and east of the limestone

storage dome.

Volume At the time of the inspection the approximate volume of

Agremax<sup>TM</sup> contained in the stockpile was 118,000 short tons.

**Components** 

Equipment and facilities of the Stockpile Area include a front-end loader, a bulldozer, a backhoe, a water truck with rear spray nozzles and front water cannon, mobile water sprinkler guns, large water hoses, fixed water spray nozzle systems, a truck wheel cleaning station and a feeder / breaker mill. It also includes a three-layer physical containment system to prevent run-on or migration of sediments and runoff from the stockpile. This triple-containment system is composed of a gabion wall, drainage channels made of reinforced concrete and concrete low wall external to an internal road at the south side of the stockpile.

## **Review of Available Information**

The available inspection records for the August 2019 to September 2020 did not identify significant issues during said inspections and action items have been addressed, to the point that the Agremax<sup>TM</sup> inventory has been reduced significantly from the previous inspection.

## **Visual Inspection**

**Date** Wednesday September 30, 2020.

**Time/Weather** Afternoon / calm wind and sunny weather conditions prevailed.

Methodology and Limiting Conditions

Due to the current pandemic limitations, an aerial drone reconnaissance of the Stockpile Area boundaries was performed. The Stockpile Area was viewed for visual evidence of signs of distress or malfunction.

**Escort** No escort was required for the desktop visual inspection.

#### General Observations

The Stockpile Area was operational at the time of the visual inspection with trucks moving up and down the access road. A main work terrace with berms on the edges was observed at the top.

#### **Access Road**

The access road was observed to be well graded, with Agremax<sup>TM</sup> berms on the edges, wetted and with some rills created by over watering.

# Stockpile Surface / Slopes

No animal burrows were observed. Slopes appeared adequate.

#### **Erosion**

Rills were observed on the east and south slopes of the stockpile, they appeared to be related to over-watering.

#### **Dust**

Dust controls, including the water truck, large water hoses and fixed water spray nozzles systems were observed. Stockpile surfaces appeared wet, therefore the water hoses and spray nozzles system were not operational at the time. No fugitive dust plumes were observed on the Stockpile at the time of inspection.

#### **Sediment**

The gabion wall surrounding the Stockpile Area was observed to be free of sediment and with an adequate setback.

#### **Drainage**

The drainage channels surrounding the Stockpile Area were observed clean and unobstructed.

#### **Containment Structures**

The low wall appeared to be structurally sound. No gaps or cracks were observed on its concrete surfaces.

#### **Conclusions**

# Changes in Geometry

The height of the Stockpile was estimated at 49 feet above ground surface; its overall horizontal extension remains within the original footprint / boundaries of the Stockpile area and the volume is reduced from that observed in the 2019 inspection e.g., the access road along the boundary with the limestone storage dome is no longer obstructed with Agremax<sup>TM</sup>.

## Potential Structural Weaknesses

Based on the visual inspection, no apparent or potential structural weaknesses of the stockpile ancillary structures were observed.

# Certification

I hereby certify that I performed a telematic inspection and prepared this Report for the Agremax<sup>TM</sup> Stockpile Area, owned and operated by AES-PR in accordance with the Coal Combustion Residuals Rule 40 CFR 257.84(b). I am a dully-licensed Professional Engineer under the laws of Puerto Rico.
